

The map illustrates the distribution of winter wheat production across the United States for the 1980-1981 and 1981-1982 seasons. The map shows county-level data with red and green numbers indicating production levels. Blue circles and lines represent specific production points or trends. The map is divided into regions by state boundaries, with a thick brown line separating the northern and southern halves of the country. The production levels are generally higher in the northern states, particularly in the Great Plains and the Pacific Northwest. The 1981-1982 season (green numbers) shows a significant increase in production in the northern states compared to the 1980-1981 season (red numbers). The map also shows a concentration of production in the central and eastern parts of the country, particularly in the Great Plains and the Midwest. The blue circles and lines represent specific production points or trends, such as the concentration of production in the Great Plains and the Midwest. The map is a detailed representation of the distribution of winter wheat production in the United States for the specified seasons.
